

PERGOLA AWNINGS

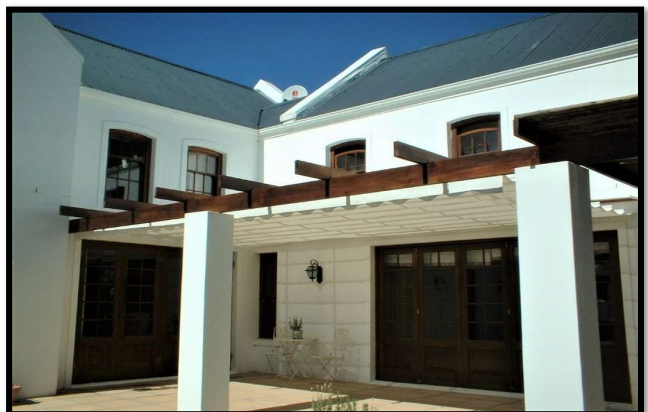

with or without WEATHER COVER

Pergola Awnings are known for withstanding the elements well and are often also used to shelter outdoor areas at cafes or to cover patios. Not to mention, pleated patio shades add a touch of style to your outdoor area, thanks to the design & patterned shadows created. Different materials are used to manufacture these type of awnings depending on the client's needs.

This awning is suspended on trolleys which run in tracks attached underneath the beams of your pergola. Alternatively it can also be suspended on stainless steel cables between walls. When retracted it folds away neatly at the back of your structure.

Please note that this awning's primary function is to provide shade. It must NOT be used in rainy conditions, irrespective of fabric selection, as water will pool on the fabric panels.

SPECIFICATIONS

- Maximum width — 6.5m (subject to site assessment)
- Maximum projection — 6m (subject to site assessment)
- Operation via pulley cord system

To protect the awning from rain an optional Weather Cover, consisting of a Meranti frame with PVC covering, could be supplied / installed.

Tubes are spaced at 50cm intervals. Take note of clearance required above doors etc as the fabric folds might present with possible problems. Should this be the case then the number of tubes can be increased in order to reduce the fabric fold size.
